

---

## Q1. Configure HTTPasswd Identity Provider

---

### Question 1. Manage Identity Providers:

- Configure the Oauth to use **HTTPasswd** as the identity provider.
- Secret name should be **ex280-secret** and Identity Provider name should be **ex280-idp-secret**.

### Create Users:

- Create user **bob** with password **indionce**
- Create user **jobs** with password **catalog**
- Create user **john** with password **warniak**
- Create user **armstrong** with password **gluengue**
- Create user **natasha** with password **sestiver**
- Create user **alice** with password **thankyou**

---

### SOLUTION

#### 1. Create the httpasswd file with all users

```
oc whoami
```

```
htpasswd -c -B -b /tmp/httpasswd bob indionce
```

```
htpasswd -B -b /tmp/httpasswd jobs catalog
```

```
htpasswd -B -b /tmp/httpasswd john warniak
```

```
htpasswd -B -b /tmp/httpasswd armstrong gluengue
```

```
htpasswd -B -b /tmp/httpasswd natasha sestiver
```

```
htpasswd -B -b /tmp/httpasswd alice thankyou
```

Check:

```
cat /tmp/htpasswd
```

---

✓ 2. Create the secret using the htpasswd file

```
oc create secret generic ex280-secret --from-file htpasswd=/tmp/htpasswd -n openshift-config
```

```
oc get secret -n openshift-config | grep 280
```

---

✓ 3. Edit the OAuth cluster configuration

```
oc get ouath
```

```
oc edit ouath cluster
```

Add this block under **spec**: (exact indentation matters):

yaml

 Copy code

```
spec:
  identityProviders:
  - name: ex280-idp-secret
    mappingMethod: claim
    type: HTTPasswd
    htpasswd:
      fileData:
        name: ex280-secret
```

Save & exit.

(mnemonic you should remember - **I Need My Tea Hot For Now**) 🍵🔥

---

✓ 4. Wait for authentication pods to restart

```
oc get pods -n openshift-authentication -w
```

Pods will go through Terminating → Running again.

A terminal window titled 'student@workstation: ~ — oc get pods -n openshift-authentication -w' showing the output of the command. The output is a table with columns: NAME, READY, STATUS, RESTARTS, and AGE. It lists 15 pods in the 'openshift-authentication' namespace. The pods are in various states: 'Terminating', 'Pending', 'ContainerCreating', and 'Running'. The 'Running' pods are 'oauth-openshift-7df78485c7-n8cz7' with 1/1 ready and 27s age.

NAME	READY	STATUS	RESTARTS	AGE
oauth-openshift-57b4bd597d-662p4	1/1	Terminating	0	9m20s
oauth-openshift-7df78485c7-n8cz7	0/1	Pending	0	3s
oauth-openshift-57b4bd597d-662p4	0/1	Terminating	0	9m42s
oauth-openshift-7df78485c7-n8cz7	0/1	Pending	0	25s
oauth-openshift-7df78485c7-n8cz7	0/1	Pending	0	25s
oauth-openshift-7df78485c7-n8cz7	0/1	ContainerCreating	0	25s
oauth-openshift-57b4bd597d-662p4	0/1	Terminating	0	9m43s
oauth-openshift-57b4bd597d-662p4	0/1	Terminating	0	9m43s
oauth-openshift-57b4bd597d-662p4	0/1	Terminating	0	9m43s
oauth-openshift-7df78485c7-n8cz7	0/1	ContainerCreating	0	26s
oauth-openshift-7df78485c7-n8cz7	0/1	Running	0	27s
oauth-openshift-7df78485c7-n8cz7	1/1	Running	0	27s

✓ 5. Verify all users can log in

```
oc login -u bob -p indionce
```

```
oc login -u jobs -p catalog
```

```
oc login -u john -p warniak
```

```
oc login -u armstrong -p gluengue
```

```
oc login -u natasha -p sestiver
```

```
oc login -u alice -p thankyou
```

Successful login = Identity Provider configured correctly ✓

✓ 6. List users

Login back by using cluster/admin user (ex: **kubeadmin** in the exam and **admin** in lab)

```
oc get users
```

```
Activities Applications Terminal Dec 12 01:40 student@workstation:~  
[student@workstation ~]$ oc get users | grep -i 280  
alice          30f5bd5a-161b-43c1-85bb-08ac81adbf7b      ex280-idp-secret:alice  
armstrong      bcf5f320-209b-4e2f-bc09-e4fa9ba56188      ex280-idp-secret:armstrong  
bob            051d0339-d756-4f23-aacd-6012ea8a86fb      ex280-idp-secret:bob  
jobs           b357ab8f-e739-4cd2-a590-e812258901dd      ex280-idp-secret:jobs  
john           ec50782d-5e1f-43cb-8930-d4143155f11d      ex280-idp-secret:john  
natasha        9f0c5114-f713-4db8-a206-3ebc94351a16      ex280-idp-secret:natasha  
[student@workstation ~]$
```

## EXPLANATION

### Create HTPasswd file

Stores user data in bcrypt format. Required by OpenShift.

### Secret in openshift-config

OAuth can only read secrets from this namespace.

### Edit OAuth provider

Adding identityProviders activates new login method.

### Operator restart

Auth pods restart → new provider becomes active.

### Test login

If login works for all users, the setup is correct.

## TECHNICAL EXPLANATION

### 1. HTPasswd Creation

- -c → create a new file (use only for the first user)
- -B → use bcrypt hashing (OpenShift **requires** bcrypt)
- -b → supply password inline  
This creates the **local user database** that OAuth will consume.

## 2. Secret in openshift-config

OpenShift authentication pulls htpasswd only from:

Namespace: **openshift-config**

If you put it anywhere else → **OAuth will not find it.**

Secret must be named **ex280-secret**.

A **generic secret** is the default secret type in Kubernetes (type: Opaque) used to store **any file or key-value data**, such as htpasswd files.

We use it because htpasswd is just a normal file and does not belong to special secret types like TLS or docker-registry. **--from-file** simply uploads the file into the secret so OAuth can read it.

---

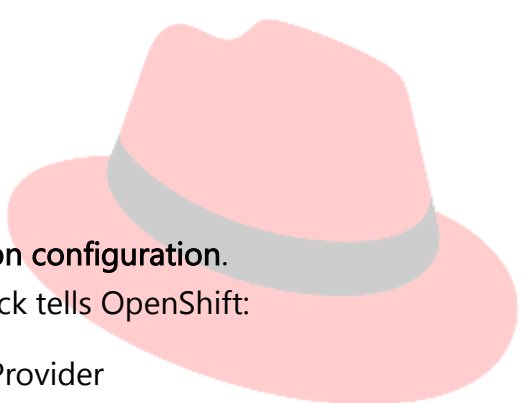

## 3. Editing OAuth

The object:

oauth cluster

is the **global authentication configuration**.

The identityProviders: block tells OpenShift:

- Enable HTPasswd Provider
  - Use secret named ex280-secret
  - Name this provider ex280-idp-secret
- 
- 

## 4. Authentication Operator Restart

After modifying OAuth:

- The **authentication operator** detects changes
- It automatically restarts pods in openshift-authentication & openshift-oauth-apiserver
- Once pods return to Running → new IDP is active

This is normal and expected.
